The references to those forms have been made available on the CRC Press website. The purpose of the review is to develop a basis for future research on the study of aging. Age is the factor that contributes most to the vulnerability of a victim. Perhaps the most salient feature of the vulnerability of older persons is the inability to adequately comprehend the situation and respond appropriately to the problems that confront them. This might be a partial or complete inability to recognize and respond to dangers. When used, the term "vulnerability" is preferred over the term "vulnerability to." The term vulnerability is more inclusive and does not limit the problem to just the elderly. The purpose of the review is to develop a basis for future research on the study of aging. Age is the factor that contributes most to the vulnerability of a victim. Perhaps the most salient feature of the vulnerability of older persons is the inability to adequately comprehend the situation and respond appropriately to the problems that confront them. This might be a partial or complete inability to recognize and respond to dangers. When used, the term "vulnerability" is preferred over the term "vulnerability to." The term vulnerability is more inclusive and does not limit the problem to just the elderly. Methodological problems related to aging have been described by several writers. The range of problems is wide. The challenges that have been described include decreased mobility, vision, hearing, cognitive ability, social support systems, transportation, environmental changes and availability of medications. The researchers who have observed the problem noted that most of the problems have a physical basis or a physical manifestation. The definition of frailty is not uniform among the writers. The term is used interchangeably with physical frailty. In his definition, Lawton defined frailty as a condition that is associated with physical vulnerability and increased risk of adverse health outcomes \[\[CR5]\]. Frailty is often viewed as a state that is predictive of adverse health outcomes. The subject of the elderly is one that was first researched by two physicians. The first was the French physician Guillotin who was the originator of the term "elderly" for the first time. The second physician was the German physician Pohl. In 1796, he wrote an article entitled "Die Verstimmung des Ruckens der Nieren mit Alkohol" \[\[CR15]\]. In the article, he identified a condition that is associated with a lot of geriatric problems, including poor balance and general muscle weakness. The 82157476af
